# 3D & 4D Ultrasounds

33 weeks

## Truly a once-in-a-lifetime moment ...

With 3D and 4D ultrasound technology you can now see every detail of your beautiful baby before birth!

## There's an amazing difference between 2D and 3D ultrasound.

The traditional 2D ultrasound performed at about 20 weeks delivers a flat, black-and-white, two-dimensional image.

30 weeks

3D ultrasound allows us to view in great detail the contours of your baby's face and body.

The 3D process delivers astonishing clarity and surface detail of your unborn child's individual features.\*

## See even more with a 3D rotational picture.

Using 3D ultrasound, we take a picture and rotate it up to 180 degrees so you can see all around your baby's face.

\* 3D and 4D ultrasounds are for entertainment purposes only. Please ensure that you have had your 20-week screening ultrasound prior to scheduling a package.

We invite you to experience the miracle of clearly seeing your baby in the womb.

36 weeks

Your 4D ultrasound session will give you a realistic first look at your baby's first movements.

You will see the baby in 3D format with real-time movement! It's almost as if a video camera were looking into the womb.

**Sessions last approximately 20 minutes. Each session costs \$200\*\***

Due to limited space in the ultrasound room, we request that you limit family and friends attending the session to three people.

For optimal scans, please schedule between 26-34 weeks gestation.

\*\* This service is not covered by insurance.

**See your baby's face for the very first time!
